Deformation and sliding bearing with PTFE sliding surface

LASTO® FLONBLOCK Type D

low-friction, durable, high-grade

mageba

LASTO®FLONBLOCK Type D

Principle

LASTO®FLONBLOCK Type D are reinforced elastomeric bearings with a PTFE sliding layer vulcanised onto one side. The PTFE surface is matched with a sliding plate made from buffed stainless steel, with a specially-treated smooth surface texture, designed to achieve minimum friction coefficients. LASTO®FLONBLOCK knuckle and sliding point bearings are used to absorb high vertical loads, torsion of the bearing surfaces, and horizontal displacements in the longitudinal and transverse directions with the minimum possible friction.

Applications

LASTO®FLONBLOCK Type D can be used wherever the displacements of the structure generate restoring forces that are too large, or where the range of permissible displacements of LASTO®BLOCK bearings is not sufficient. Despite a low bearing height, the sliding layer permits significant displacements. The forces to be absorbed are transmitted properly to the supporting structure, and rotations are absorbed through elasticity.

LASTO®FLONBLOCK knuckle and sliding point bearings deliver high-quality support in building construction, civil engineering, bridge construction, steel, wood and concrete structures, and in prefabricated construction.

- 1 Installation as a sliding point bearing
- 2 LASTO®FLONBLOCK Type D
- 3 A high-quality knuckle and sliding point bearing for low-friction load transmission to the supporting structure

Bearings for load and displacement ranges other than those given here can be requested from us at any time.

Standards and external quality control

The LASTO®FLONBLOCK elastomeric bearings described in this document conform with the European standard EN 1337-3 and have successfully passed all tests required for the CE mark.

In addition to internal quality control, LASTO®FLONBLOCK elastomeric bearings are also regularly monitored in accordance with regulations by MPA Stuttgart, an independent supervisory board officially recognised in the field of construction. The role of external quality control is to monitor our own internal quality control procedures and our compliance with the requirements stipulated in the EN1337-3 standard. This external quality control complies with the regulations of the European standard EN 1337 and is a further

guarantee of the consistent high quality of mageba products.

LASTO®FLONBLOCK elastomeric bearings can also be delivered with static certification according to other standards, for example, DIN 4141, BS5400 or AASHTO.

Friction values

The friction values generated by horizontal displacement are dependent on the pressures acting on the sliding surfaces. The PTFE layer of the LASTO®FLONBLOCK bearing is equipped with lubrication slots filled with lubricant. This makes the friction values low, and they decrease with increasing pressure.

The following friction coefficients can be used for dimensioning the construction:

Pressure	Friction coefficient	Note
5 N/mm ²	0.047	Intermediate values can be extrapolated.
10 N/mm ²	0.04	
15 N/mm ²	0.033	

1 Plate with CE mark

Technical details and installation

Displacement

The standard displacement for the LASTO®FLONBLOCK Type D sliding bearing is ± 25 mm in the longitudinal and transverse directions. The installation dimensions of the finished bearing can be freely chosen from within certain limits, but they must be at least as big as the dimensions of the sliding plate. To ensure that the bearing does not move on its base, a minimum pressure of 3.0 N/mm^2 is required.

Torsion of the bearing surfaces

Deflection of the superstructure and/or imprecise dimensions during installation cause torsion of the bearing surfaces. The angle of rotation of the bearing must not exceed the angle stipulated in the dimensions sheet.

Unlike insitu concrete construction methods, where the bearing is always free of rotation during concreting, when using prefabricated construction in precast concrete and/or steel it is necessary to take into account that rotations will be transmitted to the bearing as soon as the precast concrete unit or steel girder is fitted. For these circumstances, a suitable safety margin must be added to the calculated angle of rotation of the bearing given in the table.

Installation instructions

LASTO®FLONBLOCK sliding bearings are delivered ready for installation and must not be opened as this will ruin the long-term dust-protection for the sliding sheet. The bearings are placed without anchoring on a smooth, flat mortar bed (cement mortar with high compressive strength). The mortar bed must be at least 30mm larger than the LASTO®FLONBLOCK bearing on all sides.

The edge distances to the bearing core should be at least 50 mm on all sides. When inserting the bearing, it is important to ensure that it is installed horizontally.

The sliding plates are inserted or cast into the structure in such a way so as to ensure that their sliding surfaces are flush with the exterior concrete surfaces of the structure.

- 1 Edge distances from load-bearing core min. 50 mm
- 2 LASTO®FLONBLOCK Type D

Structural bearings

Tender texts

Example of tender text

Delivery and installation of an installation-ready, free-sliding PTFE sliding point bearing with a 2mm stainless steel sliding plate.

Type: LASTO®FLONBLOCK Type D

Displacement: ± 25 mm

Load (N_d): 180 kN

Core (LB x LL x D): 100 x 200 x 30 mm

Sliding plate (PB x PB x h): 210 x 260 x 2 mm

Installation size (AB x AL x H): 230 x 280 x 32 mm
