

SEISMIC EXPANSION JOINT SYSTEMS

DESIGNED FOR EXTREMELY HIGH MOVEMENTS,
EASY INSTALLATION, ALL TYPES OF FINISHES,
FLEXIBLE USE AND EARTHQUAKE SEISMIC PROTECTION

MIGUMAX

YOU FIRST.

MIGUA is one of Europe's leading experts in the design, manufacture and installation of expansion joint systems. MIGUA expansion joint systems serve to cover, close and conseal expansion joints. Our products satisfy the most rigorous standards in quality and safety and are widely used in large-scale construction projects such as airports, train stations, industrial plants, parking structures, shopping centres and hospitals. Every day, our experienced team do their utmost to ensure that our outstanding product quality and innovative approach make your building project successful. We are not satisfied until you are satisfied. Because our guiding principle is:

MIGUA – you first.

Over 600 products for one purpose:

Yours

With five brands and a total of over 600 proven expansion joint systems, we've got the diverse structural needs of today's construction projects covered. We confront problems such as heavy traffic loads and meet exacting standards in water resistance or hygiene. Floors, walls or roofs, MIGUA offers the perfect solution for any surface. Products of the highest quality are fundamental to our business; yet our ultimate priority is always customer satisfaction.

THE COMPREHENSIVE PRODUCT RANGE OF SEISMIC EXPANSION JOINT SYSTEMS

EXPANSION JOINT SYSTEMS

Expansion joint profiles are mostly made of aluminium or steel, either solid metal or assembled together with rubber inserts or gaskets in rubber. They are designed to accommodate the large movements of a construction, including settlement and, sometimes seismic deflections.

Movements may be caused by temperature and drying shrinkage, the supporting substrate, winds forcing the structure to sway or earthquake activity beneath the structure.

The most important criteria when selecting an expansion joint system are the following:

- Gap – the structural engineer has to indicate the anticipated movement of the structure and as a result the joint width based on the static calculation and dynamic analysis.
- Load bearing capacity – knowing the maximum loading the expansion joint system has to withstand is of utmost importance. Exceeding the load capacity of the system will cause it to fail. Loads are specified in DIN 1055 and DIN 1072.
- Movement capacity – precondition of selecting the correct profile is knowing the horizontal and/or vertical movement/s. Consideration must be given to the foundations and settlement in mining and seismic zones. In addition to this information it is important to consider watertightness and chemical reaction requirements.

Apart from those decisive criteria it is also important to know about requirements on watertightness, chemical attack, etc.

EARTHQUAKES

Earthquakes mainly occur at the boundaries of the tectonic plates forming the Earth's crust. Hence, they are not only categorized by their magnitude but also by the place where they occur.

The world is divided into more than 700 regions, the more active regions being divided into smaller sub-regions. The less active regions are subdivided into larger zones.

Over long periods of time the movement of tectonic plates creates severe stress. The plates move continually making it virtually impossible to predict short or medium term earthquakes. The movement of the plates strains or deforms the rocks along the plate boundaries until the rocks can no longer sustain the strain. Then a sudden slip along the faults releases energy that causes earthquake shaking.

Fortunately most earthquake-prone areas occur in sparsely populated regions. However, some densely populated and rapidly growing cities such as San Francisco and Tokyo are in areas of high seismic activity.

Specifications regarding the load capacity

Pictogram					
Meaning	Pedestrians	Private cars	Lorries DIN 1072	Forklift trucks DIN 1055	Hard castors

The load specifications of air-filled and solid plastic tyre trucks apply to a wheel contact patch of 200 x 200 mm.

Note regarding installation

Assembly and installation instructions are available on request. Please speak to us.

Alternatively, information can be downloaded from www.migua.com.

All information given refers to the joint width by the time of installation. The potential margin amounts to +/- 10 mm.

Please note that we subdivide all general information into thermal and seismic movement. The very load bearing capacity mentioned refers to thermal movement only.

We reserve the right to make technical changes.

If you have any questions about our products, we would be happy to help.

MEASURING EARTHQUAKES

Earthquakes are recorded by so called seismometers – the absolute magnitude of a quake is determined by the ground motion for specific seismic waves and recorded by numbers on the Moment magnitude scale (formerly Richter scale).

The report of the magnitude scale is logarithmic, i.e. an earth-quake of magnitude 8 is 10 times the amplitude of a tremor of magnitude 7 and 100 times the amplitude for a tremor of 6. Much more impressive when comparing the energy generated: an earthquake of magnitude 8 radiates 30 times the energy of an event of magnitude 7 and 900 times the energy of an event of magnitude 6.

EARTHQUAKE DAMAGE

Major effects created by earthquakes are shaking and ground rupture. As a result varying degrees of damage occurs to buildings and other rigid structures, depending on the combination of magnitude (strength and duration of shaking), distance from the epicenter and the local geological conditions.

Strength decreases rapidly with distance from the epicenter – it becomes half as strong at a distance of 8 miles and a quarter as strong at a distance of 17 miles. In terms of geological conditions, shaking is increased in soft, thick, wet soils.

WORLD-WIDE EARTHQUAKES AND THEIR CONSEQUENCES

Scientists evaluate around 500.000 earthquakes each year, from which 100.000 can actually be felt. The major part and even the largest one's take place in the 40.000 km long circum-Pacific seismic belt, well known as the Pacific Ring of Fire.

In the U.S. earthquakes are most common in California and Alaska, but also in Hawaii, Montana, Nevada, Washington, Quebec, etc.

Affected states have already adopted codes requiring some level of protection. As a result of such legislation buildings constructed to the required standards have life saving and damage avoidance/limitation features not found in older buildings.

The various national codes set minimum standards to ensure life safety, but do not reflect on specific damage and loss of function. Today, there are different ways to protect and prepare from severe damage: earthquake engineering, earthquake preparedness, household seismic safety, seismic retrofit (including special fasteners, materials and techniques). Seismic retrofitting means modification of existing structures to make them more resistant to seismic activity, ground motion or soil failure due to earthquakes.

Among others, preparedness can be achieved by using seismic expansion joint systems, particularly in multi-storey buildings where joints become wider on upper floors in reaction to the increased seismic sway.

EXPANSION JOINTS ACCORDING TO AREAS OF APPLICATION

Floor expansion joint systems (Floor)

Miguma seismic floor expansion joint systems are especially designed to cope with large movements typical for earthquakes. At the same time, they accommodate day- and night-time as well as seasonally conditioned thermal movements. Miguma seismic expansion joint covers are characterized by their aesthetic design and ensure a maximum of comfort. Not least, they are cost-efficient due to their high quality, easy installation and longevity.

Wall expansion joint systems (Wall)

Miguma seismic wall expansion joint systems are made to exceed even the highest demands. The design provides for a seamless transition from floor to wall expansion joints that ensures a harmonious architectonic impression. The most innovative product in this range is the WSP that can be tailor-made to perfectly suit your individual needs.

Roof expansion joint systems (Roof)

Miguma roof expansion joints feature highest functionality. The design allows for both the absorption of three-dimensional thermal as well as seismic motion. Moreover, all Miguma roof expansion joint systems are specifically optimized for fast and easy installation.

Fire barrier, fire protection (Miscellaneous)

In addition to MIGUMAX expansion joint cover range, we offer professional accessories such as firebarriers, sealing foils and many more. Due to the vast variety of solutions on offer, we have chosen to show some examples only. In case you are in search of individual solutions, we are only too pleased to be of help.

reddot design award
winner 2017

- 1 Visually appealing**
The centre plate can be individually designed to match the adjacent surface. The design variation is practically infinite.
 - 2 No visible fixing**
 - 3 Easy to install**
The bar construction ensures easy installation of the centring system. The centre plate is assembled after finishings are completed, thus minimizing the risk of damage by other contract work sections.
- Maintenance-free**
No permanently elastic sealing required
Comes with plate in standard white. Any design is possible.
Please contact us.

SEISMIC WALL COVER

WSP – FLEXIBLE DESIGN

With this innovative wall joint cover named WSP, Migua, created an outstanding design that the expert committee for the Red Dot Award has recognised with the internationally sought-after seal of quality.

This seismic wall joint cover WSP is setting new standards. A joint of 30 cm is covered by the WSP without any visible fastening material while its intelligent construction can accommodate ± 15 cm movement non-destructively. A conventional joint cover solution would show a 62 cm wide visible

surface made of metal and rubber. In contrast, the WSP reduces the visible surface to 2 x 7 cm by integrating a freely designable panel. This offers entirely new design options for architects. For the first time ever, virtually invisible wall joints can be realized, or the exact opposite can be achieved: The joint can be intentionally highlighted as a functional design element, e.g. as a part of a building guidance system.

Please contact us for further details.

- 1** **Cover plate can be individually coated**
to match the adjacent wall
- 2** **Long-lasting aluminium surface**
with only little fixing due to larger distance of fixing holes, still ensuring perfect hold

FIRE BARRIERS FOR ALL KINDS OF EXPANSION JOINTS

MIGUA offers fire barriers for all kinds of expansion joints. This fire barrier is a blanket type fire barrier, tested and proven to provide a 2-hour fire resistant rating, minimize smoke passage and

accommodate dynamic movement without degradation of the material. Designed for expansion joints ranging from 1" to 20" for floor and wall applications.

Technical Data

- UL 2079 - 2 hour rating
- 50% Dynamic movement

Key Features

- Accommodates dynamic movement
- Can be integrated with most of the expansion joint cover models.
- Caulk-free application
- Factory formed transitions
- Easy to install.

Application

- Designed for floor and wall joint gaps
- For 2 hour fire rated requirement
- Suitable for gap sizes from 1" to 20"
