mageba expansion joints – for lasting driving comfort

TENSA® FINGER Type RSFD
robust, reliable, quiet
Product Characteristics & Benefits

**Principle**
The mageba TENSA®FINGER RSFD cantilever finger joint has proven itself for use in bridges with heavy traffic loading and for movements between 2.4 inches (60 mm) and 19.7 inches (500 mm). The joint’s robust steel edge profiles have strong anchor loops for concrete anchoring to the main structure, resulting in excellent fatigue resistance. The cantilevering finger plates are connected to the steel profiles by pre-tensioned friction-grip bolts. Beneath the finger plates, a watertight drainage channel, which is dimensioned to facilitate all joint movements, is connected to the edge profiles. The TENSA®FINGER expansion joint is suited to both asphalt and concrete road surfaces. For greater movements, together with high traffic loading, mageba recommends the statically better suited TENSA®FINGER GF sliding finger joint, to minimize the transfer of moment to the supporting structures.

**Properties**

**Noise-reducing Surfacing**
The geometry of the cantilevering fingers avoids a straight transverse gap in the carriageway. The wheels of passing vehicles thus maintain constant contact with the expansion joint’s surface, reducing the noise caused by impacts with the gap edge. This results in low noise emissions and high driver comfort. TENSA®FINGER cantilever finger expansion joints are thus ideal for use on bridges near residential areas or in other noise-sensitive zones.

**Surface Profiling**
To improve the ability of vehicle wheels to grip the surface of the joint’s finger plates, they can optionally be delivered with a ¹⁄₁₆" (2 mm) deep surface pattern. This improves traffic safety, especially on joints with large movements and thus large surface areas.

**Drainage Channel**
Beneath the expansion joint, a watertight drainage channel of flexible material or stainless steel is attached. This features rounded end-pieces at both ends, and a flexible discharge outlet at its low point for connection to the bridge’s drainage system. The channel can be easily flushed clear of any gathered sediment during periodic bridge cleaning activities. To facilitate this, an external hose connection point can optionally be provided in the non-trafficked part of the joint. If desired, the channel can also be delivered with a dirt-repellent surface, reducing cleaning effort to an absolute minimum.

**Shuttering Plates**
Steel shuttering plates not only provide support to the fresh concrete during pouring, considerably reducing construction effort, but also serve as a connection surface for the drainage channel. They can alternatively be made from stainless steel to enhance their durability.

**Benefits**
- Robust, durable construction with well-proven design
- Use of high-quality materials ensures a long service life
- Optimized life-cycle costs due to high product quality
- Improved noise protection due to interlocking of cantilever fingers
- 100 % water tightness due to specially developed drainage channel
- Adapts easily to suit different road surfacing thicknesses
Material Properties & Dimensions

Materials
The following high-quality materials are used in the manufacture of TENSA®FINGER expansion joints:

- Finger plates: ASTM A709 Grade 50 steel
- Support structure: ASTM A709 Grade 36 steel
- Drainage channel of EPDM, soft PVC or stainless steel, according to customer preference

Corrosion Protection
The steel edge profiles are treated with corrosion protection systems based on hot dip galvanizing ASTM A-123 / AASTHO M111, or any applicable painting systems approved by the responsible Department of Transportation (D.O.T.).

Main Dimensions

Type RSFD-A (for asphalt connection)

- Expansion joint for asphalted roads with surfaced thicknesses of between 2 in and 10 in (50 mm and 250 mm)
- Edge profiles feature flanges for connection of deck waterproofing membrane
- Well-proven, fatigue-tested loop anchorages

Cross-section: Type RSFD-A

Type RSFD-B (for concrete connection)

- Expansion joint for concrete roads or sidewalks
- Well-proven, fatigue-tested loop anchorages

Cross-section: Type RSFD-B

Quality & Support

Quality
For five decades, mageba expansion joints have proven their worth in thousands of structures under the most demanding conditions. In addition to the product properties, the extensive experience of our well-qualified manufacturing and installation staff also contributes to the high quality and durability of the products.

mageba has a process-orientated quality system. In addition, its quality is regularly inspected by independent testing institutes. mageba factories are AISC certified for Major Bridges (CPT, STD, SPE) and also maintain AWS certifications for D1.1 and D1.5.

Tests and National Approvals
TENSA®FINGER cantilever finger joints have been subjected to extensive testing and analysis to verify their properties and performance. The anchorage, for example, has been thoroughly tested in dynamic fatigue tests, with 2 x 10^7 load cycles at a frequency of 2.75 Hz and loads of up to 31.5 kips (140 kN). Under this loading, the anchorage fulfilled the demanding requirements of the AASHTO CRFD standard. The system has also been awarded with national approvals in numerous countries around the world.

Installation
The expansion joint is pre-assembled in the factory and fixed at the desired pre-setting value (gap width) by cross-beams. mageba installation technicians precisely position the joint on the main structure, and fix its anchorages to the structure’s reinforcement. The concrete is then poured, fully securing the joint to the bridge.

Related Products
The following mageba products can be used in combination with TENSA®FINGER cantilever finger joints:
- **ROBO®DUR**: Strengthening ribs of special mortar, which reinforce the asphalt adjacent to the joint. These reduce rutting while increasing driver comfort and the durability of the joint
- **ROBO®MUTE**: Noise-protection system, consisting of mats placed beneath the joint to reduce noise emissions
- **ROBO®GRIP**: Anti-skid coating with high coefficient of friction, preventing skidding of passing vehicles in wet conditions
- **ROBO®STATIFLEX**: Strengthening strip of quick-hardening polymer concrete along the side of an expansion joint, which reduces rutting while increasing driver comfort and joint durability

Customer Support
Our product specialists will be pleased to advise you in the selection of the optimal solution for your project, and to provide you with a quotation.

On our website, [mageba-group.com](http://mageba-group.com), you will find further product information, including reference lists and tender documentation.
